

### Networking & Servers

Many small and medium businesses have computer networks that have been implemented and expanded without any real planning. As these networks grow larger, they often suffer from poor performance and frequent outages. We can help you upgrade to a **solid, professionally designed network** that will continue to serve you as your organization expands.

Whether you have old systems being held together by duct-tape, need new servers to support expansion, or are having issues getting your existing environment to function how you want it to, we can help. Using industry best practices, we will setup and configure network switches, routers, and wireless systems along with Microsoft or Linux servers to help your organization function more efficiently. We can help with:

- Network Design, Implementation, and Maintenance
- Server installation and configuration
- Small business virtualization

### Desktop Support & Management

If users' computers are down, error-prone, or vulnerable to security threats then their productivity is being limited. Desktops and notebooks are most reliable when they are being properly managed and up to date. We would love to help your organization manage your client systems more effectively. We will help you troubleshoot and fix the errors that users encounter, and implement solutions to **prevent the errors from occurring in the first place**. Simpliciti Solutions will help you employ:

- Group Policy Management
- Windows Server Update Services
- Antivirus, firewall, and anti-spyware applications

### Application Development

Off-the-shelf software isn't always a perfect fit. If customizing the software for your environment seems like a daunting or near-impossible task, **consider custom developed software**. Because we will tailor it specifically to your business or industry, it will fit into your existing workflows.

We can develop lightweight desktop and web applications for your business. By focusing on the features important to you, we will strive to help you avoid the complexity of off-the-shelf software that attempts to do everything for everyone. Instead of paying a fortune on licensing, customization, add-ons, and upgrades (and still not getting what you want), we can make applications that do just what you want them to!

We can develop:

- Web applications using PHP and ASP.NET
- Windows applications with the Microsoft .NET Framework
